

## ABSTRACT

A beating appliance (1) for cheering easy to beat and suitable for carrying, comprising a body portion having a plurality of tubular members (10), (20), and (30) reduced in diameter from one end to the other end in the longitudinal direction and combined with each other so as to be extended/retracted. The tubular members (10), (20), and (30) adjacent to each other are brought into an extended state by connecting the inner peripheral surfaces of the large diameter side tubular members (10) and (20) to the outer peripheral surfaces of the small diameter side tubular members (20) and (30) in taper-stacked states, and brought into a retracted state by storing the small side tubular members (20) and (30) in order and in a nested state in the large diameter side tubular members (10) and (20). Also, a head cap (40) is fitted to one end of the maximum diameter tubular member (10), and an end member (50) having a diametrically grip end (51) is fitted to the other end of the minimum diameter tubular member (30).
